

GIUNTI SERIE GIFLEX GE-T

Appendice Tecnica

INTRODUCTION

Flexible torsion couplings, which are connecting devices between rotating shafts, are designed to ensure shock-free torque transmission and to compensate minor alignment deviations in operation between the shafts in industrial use.

The GE-T range of flexible couplings ensures this level of performance and also provides excellent quality thanks to the machining accuracy and the choice of materials.

The general level of reliability provided by the GE-T couplings results in a long life operation.

GENERAL

The GE-T range of flexible couplings represents torsionally flexible mechanical couplings capable of transmitting a twisting moment proportional to the flexible yield of the intermediate component. The couplings must be capable of effectively absorbing possible torsional vibrations due to the load or self-induced, to attenuate impacts and torque peaks during the start-up phase and to compensate minor angular and parallel misalignments between the shafts, however ensuring an acceptable useful working life.

These features and more in general the performance required from the coupling depend almost exclusively on the quality intermediate component.

The choice of the material used to manufacture the coupling is therefore fundamental. The curve that expresses the flexible characteristic of the intermediate component must have a progressive trend (yielding at low torque values and remaining rigid at higher torque values) to ensure operation without jerks at start-up and with a limited torsional yield at steady state conditions.

It is essential for the intermediate component to have a certain flexible hysteresis, proportional to the required absorbing effect that ensures the coupling can efficiently absorb possible torsional oscillations.

Furthermore, the useful working life of the coupling depends on the flexible yield of the material comprising the intermediary component. The physical characteristics has described above are frequently in contrast with each other and compared with other basic mechanical and technological parameters. The performance of the intermediary component therefore cannot be adapted to the variety of operating conditions when only one type of material is used and therefore the materials adopted for the flexible ring gear must be differentiated.

A selected thermoplastic elastomer is selected to meet medium level needs in the basic execution. This refers to an elastomer with medium rigidity, characterised by an optimum internal dampening effect, resistant to ageing, to fatigue, to abrasion, as well as hydrolysis and to the principle chemical agents with special reference to oils and ozone. Operating temperatures lying between -40 °C and + 125 °C with brief peaks of up to 150 °C are permitted in the case of couplings in the base execution. Alternative mixes capable of meeting every practical need have been designed and are available on request for use in extremely demanding operating conditions, or for needs that exceed average requirements.

OPERATING AND ASSEMBLY CONDITIONS

Operation of the flexible torsion couplings, such as the GE-T type or similar couplings is characterized by a proportional feature between the twisting torque and the torsion angle and by the ability to compensate limited angular and radial misalignments.

Key features of equal importance, but which are more difficult to interpret are represented by the absorbing factor and natural frequency or resonance.

To qualify its couplings, Chiaravalli Trasmissioni SpA declares permitted twisting torque values correlated to well defined torsion angle values, which has the limiting value of 5 ° C corresponding to the maximum torque value. This provides a valid guide for the progressive characteristic of the flexible curve. The maximum permitted values are shown in the case of the angular and radial misalignments, with the warning that these refer to extreme values that cannot be added together (only angular compensation or only radial compensation) and apply to standard operating conditions characterised by the following: operating torque not exceeding the nominal torque, a rotating speed of less than 1,450 r.p.m and coupling temperature not exceeding 40° C.

The maximum rotating speed expressed in r.p.m that corresponds to maximum peripheral speed of 30 m/sec. is indicated for each coupling of the GE-T range.

This speed can be achieved with a sufficient safety margin compared to the danger of failure due to centrifugal force stress thanks to the characteristics of the material used.

Class G 2.5 dynamic balancing in compliance with ISO 1940 is recommended despite the fact that the half-couplings are fully machined on both external surfaces, if the actual operating speed exceeds 2.800 r.p.m.

Pieces available with E-coating.

Scan the QR Code to gather more information regarding e-coating

COUPLING SELECTION AND SIZING CRITERION

Couplings are sized on the basis of the physical laws of mechanics and the resistance of the materials and also complies on the provisions established in the DIN 740 standards. the coupling is selected on the basis of the criterion, which establishes that the maximum permitted stress is never exceeded even in the most demanding operating conditions. It follows that the nominal torque declared for the coupling must be compared with a reference torque that takes into account the overloads due to the way the load is exerted and the operating conditions. The reference torque is obtained by multiplying the operating torque by a series of multiplying factors depending on the nature of the load or on the ambient temperature conditions.

LOAD DUE TO NOMINAL TORQUE

The permitted nominal coupling torque TKN must apply for any operating temperature value equal to or greater than the driven side operating torque TLN.

$$TKn = 9549 \frac{(PLn) [Nm]}{nLn}$$

The following condition must be satisfied, where St represents the temperature factor, to take into account overloads due to the operating temperature for the coupling.

$$TKn > TLN * St$$

START - UP LOAD

The drive motor delivers a drive torque during the start-up transient period which is a multiple of the nominal torque and depends on the way the masses are distributed. A similar situation occurs in the braking phase therefore, this two phases are characterised by torque impacts that have an intensivity which depends on the distribution of the masses on the drive side MA and on the driven side ML, as well as the frequency of the number of start – ups on which the start – up factor Sz depends. The static torques for the drive side and the driven side are expressed by the following relationships:

- drive side $TS = TAS * MA * SA$

- driven side $TS = TLS * ML * SL$

MA and ML are assumed to be equal to 1, to first approximation, and if the distribution of the masses is unknown. The SA factor can be assumed as being equal to the relationship between the start – up torque and the nominal torque in the case of drives based on an electric motor.

LOAD CAUSED BY TORQUE IMPACTS

The permitted nominal coupling torque TKN max must be equal to or greater than the start-up torque increased by the temperature factor and by St and by the start-up factor Sz for any operating temperature value.

$$TKn_{max} > TS * St * Sz$$

Consult the CHIARAVALLI Trasmissioni Technical Department for operating conditions that foresee periodic variation or torque inversions, as well as alternate torsional stresses.

SYMBOLS

- Tk n** = coupling maximum torque (Nm)
- Tk max** = coupling maximum torque (Nm)
- Tk w** = torque with coupling inversion (Nm)
- TLN** = driven side operating torque (Nm)
- TLs** = driven side static torque (Nm)
- TAs** = motor side static torque (Nm)
- Ts** = plant static torque (Nm)
- PLn** = driven side operating power (Nm)
- nLn** = driven side rotating speed (r.p.m)
- St** = temperature factor
- JA** = inertia moment drive site
- JL** = exit side
- SA** = motor side impact factor
- SL** = driven side impact factor
- Sz** = start-up factor

MA = control side mass factor $\frac{JL}{JA + JL}$

ML = driven side mass factor $\frac{JA}{JA + JL}$

INDICATIVE VALUES FOR ADJUSTMENT FACTORS:

Name	Symbol	Definition				
		St.	1	1	1,4	1,8
Temperature factor	St.	C°	-30°	+40°	+80°	+120°
			+30°			
		Number of start-ups per hour				
Start-up factor	Sz.	Start-up/hr	100	200	400	800
		Sz.	1	1,2	1,4	1,6
Impact factor	SA/SL					SA/SL
		minor start-up impacts				1,5
		medium start-up impacts				1,8
		major start-up impacts				2,2

SERVICE FACTORS:

Load condition	Operating conditins	Type of Drive	
		Electric motor	Diesel engine
UNIFORM	Regular operation without impacts or overloads	1,25	1,50
LIGHT	Regular operations with minor and infrequent impacts and overloads	1,50	2,00
MEDIUM	Irregular operation with medium overloads for a short duration and frequent but moderate impacts	2,00	2,50
HEAVY	Markedly irregular operation with very frequent impacts and overloads and of major intensity	2,50	3,00

GE-T SG SERIES BACKLASH-FREE TORSIONAL COUPLING

INTRODUCTION

The aluminium flexible couplings GE-T SG are made of three pre-tensioned elements in backlash-free execution. They are meant for the coupling mounting and they are designed to fit low torque working units and industrial processing, where they must satisfy certain requirements.

Thanks to their limited dimensions and their easy mounting, they can operate in little space and any project can take big advantages of it.

FEATURES

The buckle tightening guarantees a quick and sure fixing without extension between shaft and hub. It is however important to keep the screw tightening torque (MS) shown in the table. Besides testing the size of the coupling given in the table, it is suggested to test the maximum torque of buckle to diameter (F).

The elastomeric element, that has a star shape, is set into the hubs' hollow seats with a light pre-tensioning, ensuring the needed transmission torque backlash-free execution.

IL Cuscinetto srl - www.ilcuscinetto.it - info@ilcuscinetto.it - 0432/481613

DESIGN A

Solid hub size 9 and 14 for 4-spikes elastomer, size 19 for 6-spikes elastomer

DESIGN B

Solid hub from size 24 to 38 for 8-spikes elastomer

DESIGN C

With single-cut clamp from size 9 to size 19, torques suitable according to hole-diameter.
 Also available with the compact version from size 9 to size 38

DESIGN CK

With single-cut clamp and keyway acc.to DIN 6885 - JS9 , from size 14 to size 19. Also available with the compact version from size 9 to size 38

DESIGN D

With double-cut clamp from size 24 to size 38, torques suitable according to hole-diameter

DESIGN DK

With double-cut clamp and keyway acc.to DIN 6885 - JS9 , from size 24 to size 38

DESIGN H

With 2x screws fixing clamp for radial mounting, torques suitable according to hole-diameter. Available from size 14 to size 42

DESIGN HK

With 2x Screws fixing clamp for radial mounting and keyway acc.to DIN 6885-JS9. Available from size 14 to size 42
